The new 911 on a ski slope: Kings of the hill

What better way to test the power and traction of the new 911, than by sending it up a ski slope high in the Pyrenees?

Early in the morning, before the busy runs opened to the public, the 911 was joined by a new Macan and charged with driving to the top of a steep slope, 2,400 metres above sea level. Both cars were completely standard and simply fitted with Porsche-approved winter tyres.

Enrique Monteverde, Marketing Manager at Porsche Ibérica, explained: "The new 911 has a much wider track front and rear and we took advantage of this, the all-wheel drive and the Porsche Traction Management system to get all of his power perfectly on the ground, here on the snow." "We wanted to demonstrate how quick the 911's reaction times are, even on extreme surfaces, and that the same agility is possible with the smaller-engined Macan." "The conditions were perfect but it was the ease with which the cars took on the mountain that really impressed the crowd."
